

ABSTRACT

DEVICE FOR INJECTING A PRODUCT, PARTICULARLY FOR MEDICAL USE

This device comprises:

- a body housing a hollow injection needle and a container containing the injectable product; the needle is connected to the body but able to move relative to the latter between an injection position and a retracted position;
- a plunger that slides in the body and is displaceable relative to the latter to perform the injection; said container is able to move relative to the plunger between a position that enables the injection to be performed and a retracted position;
- means for keeping the needle and the plunger in injection position, which means can be released to free the needle and the plunger to move to said retracted position.
